

Biology PYQ-Pattern Practice

Original exam-pattern practice; not verbatim past-paper copies

Cell & Genetics Pattern Practice

- Identify the organelle associated with a stated cellular function.
- Differentiate prokaryotic and eukaryotic cells using a structural feature.
- Predict offspring ratios from a simple Mendelian cross.
- Identify the correct stage of mitosis or meiosis from a described chromosome arrangement.
- Determine the complementary DNA sequence from a given strand.

Plant & Animal Biology Pattern Practice

- Match a plant group with its representative and characteristic feature.
- Identify a tissue from its location and function.
- Match an animal phylum with a diagnostic characteristic.
- Identify a reproductive structure from a labelled or described diagram.
- Arrange major events of a reproductive process in correct sequence.

Human Physiology Pattern Practice

- Trace the pathway of air through the respiratory system.
- Identify the chamber, vessel or valve involved in a stated circulation event.
- Match a hormone with its gland and principal effect.
- Identify the nephron segment associated with a described process.
- Determine the correct sequence in neural or endocrine regulation.

Ecology & Biotechnology Pattern Practice

- Identify the trophic level of an organism in a food chain.
- Interpret a simple population or ecological graph.
- Match an environmental problem with its likely effect.
- Identify the purpose of a biotechnology step from a short description.
- Choose the correct application of recombinant DNA technology.

Answer Guidance

- Read every option carefully; Biology questions frequently use nearly identical terms.
- Use elimination based on exact definitions, locations, sequences and examples.
- For diagram questions, identify the whole structure first and then the labelled part.
